LESSON: **DEVOPS**

SUBJECT: Kubernetes-1 İnstalling

BATCH B 224 **AWS-DEVOPS**

+1 (585) 304 29 59

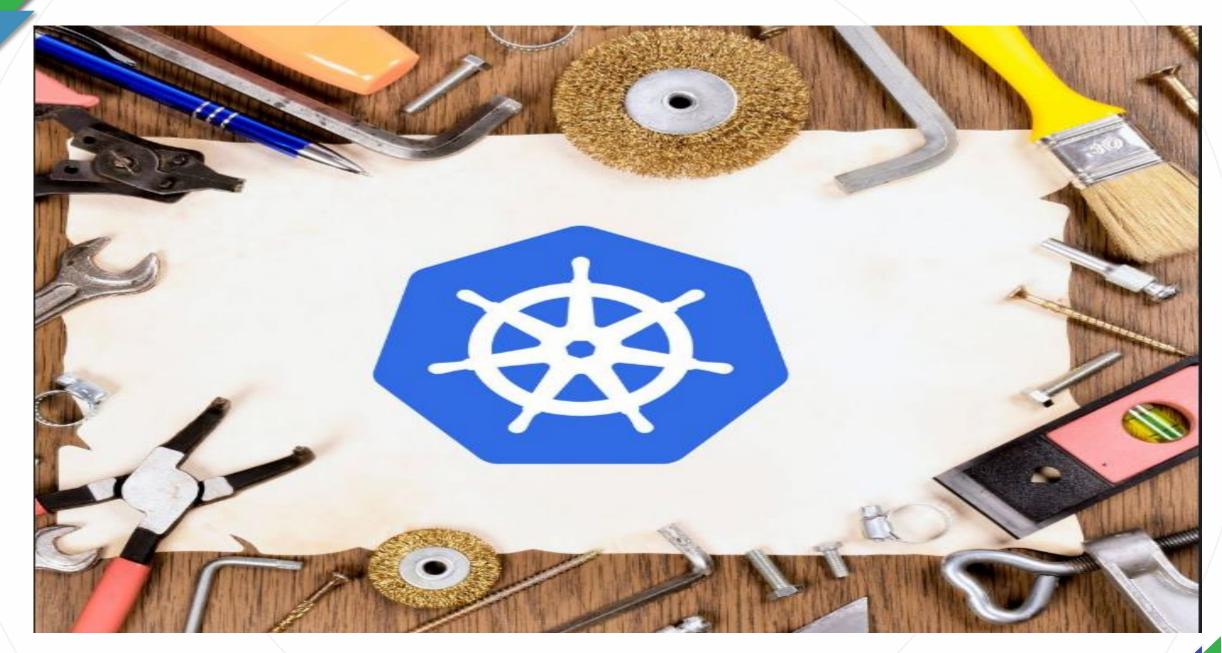

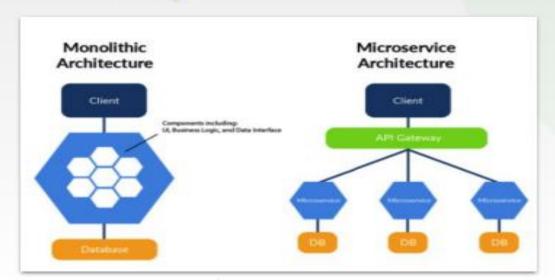

Table of Contents

- Monolith vs Microservices
- Orchestration
- Declarative vs Imperative
- What is Kubernetes?
- Why you need Kubernetes?
- Kubernetes components
- kubectl

- Microservice applications are scalable, flexible and more reliable.
- Features are independent.
- Each service is deployed individually. Continuous deployment is easier.
- Complex

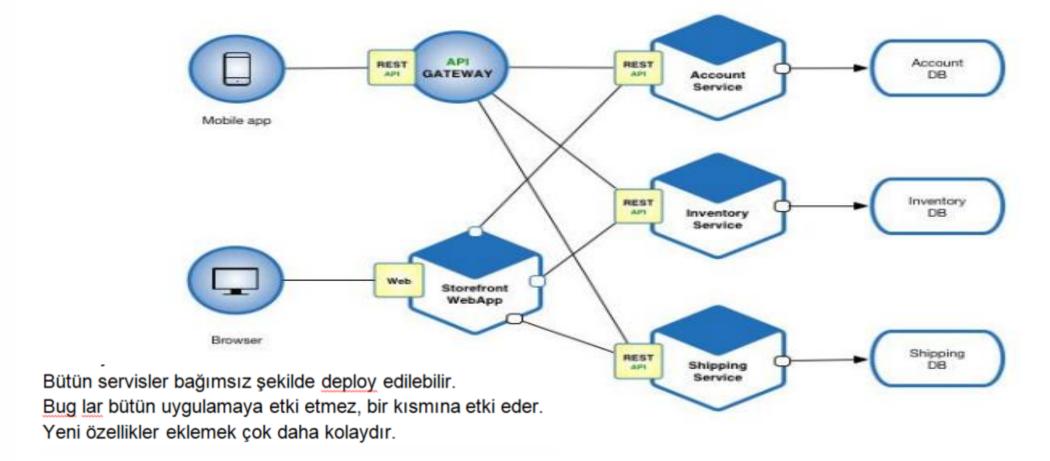

- Monolith applications are simple to develop, test and deploy.
- Difficult to scale.
- Features depend on each other.
- Not cost-efficient in the long run.
- Entire codebase is deployed.
 Continuous deployment is difficult.
- Difficult to maintain, update.
- Change in a framework will affect the entire application.

The word 'monolith' means 'one massive stone'. So we can describe monolithic as a large unified block.

Declarative vs Imperative

imperative focuses on how and declarative focuses on what.

- 1. Temeli oluşturun
- 2. Çerçeveye yerleştirin
- 3. Duvarları ekleyin
- 4. Kapı ve pencereleri ekleyin

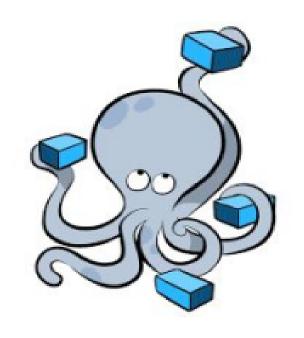

Imperative approach:

- Build the foundation
- Put in the framework
- Add the walls
- Add the doors and windows

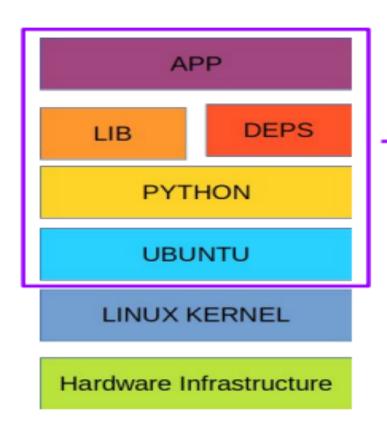

Declarative approach:

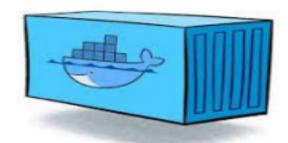

I want a tiny and cute house.

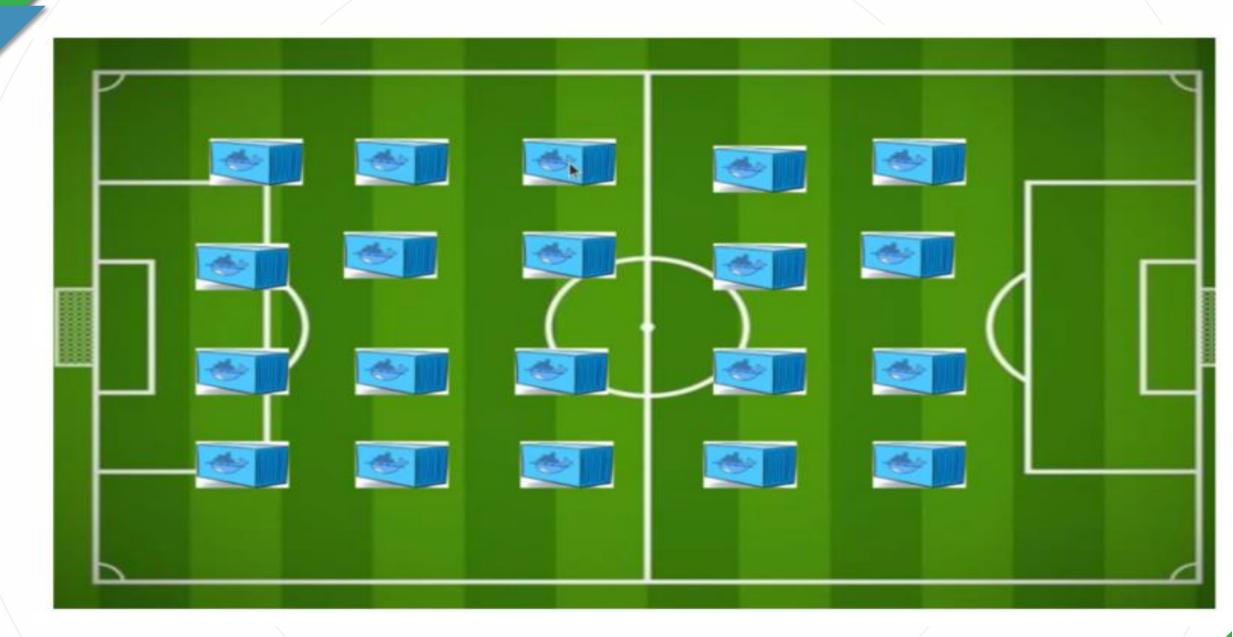

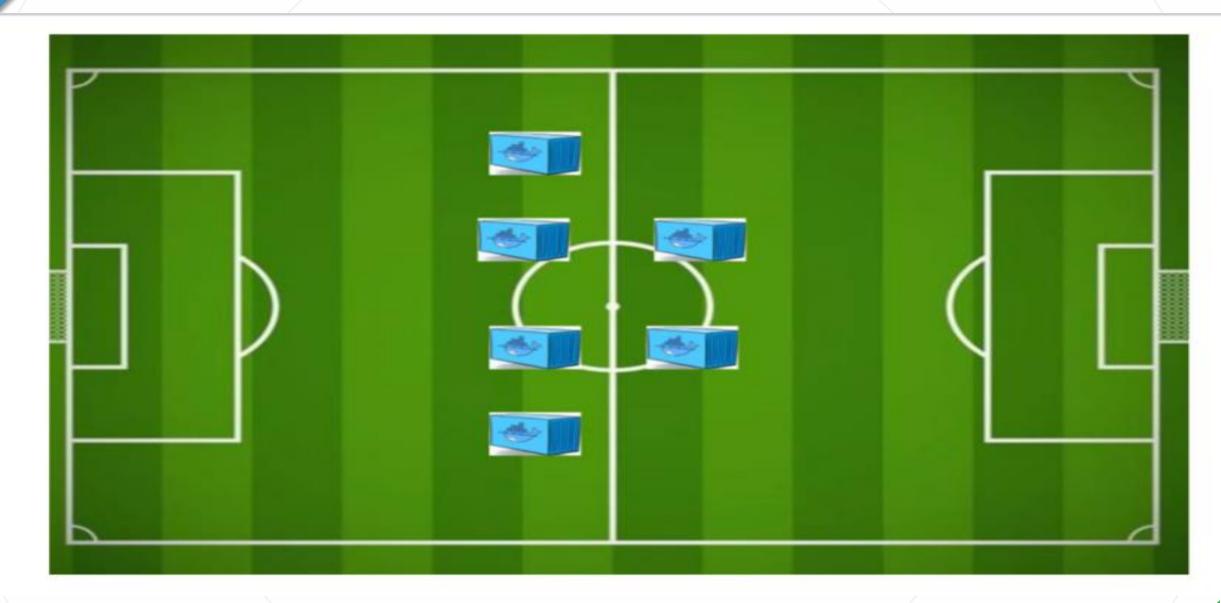

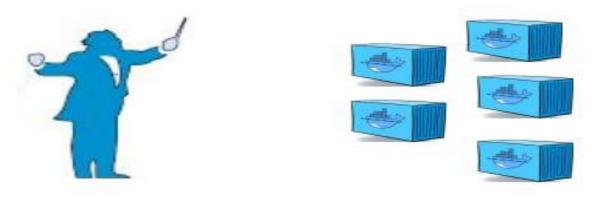

- Containers are great, but when you get lots of them running, at some point, you need them all working together in harmony to solve business problems.
- Tools to manage, scale, and maintain containerized applications are called orchestrators, and the most common example of this is Kubernetes.

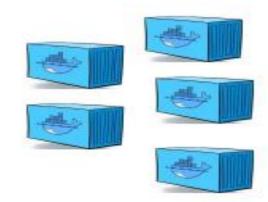

Container orchestration is used to automate the following tasks at scale:

- Provisioning and deployments of containers
- Availability of containers
- Load balancing, traffic routing and service discovery of containers
- Health monitoring of containers

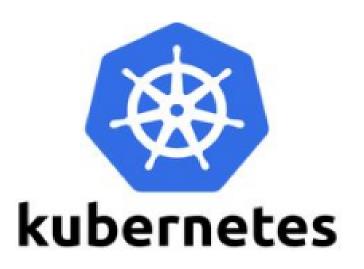

- Securing the interactions between containers.
- Configuring and scheduling of containers
- Allocation of resources between containers

What is Kubernetes?

What is Kubernetes?

- Born in Google
- Donated to CNCF in 2014
- Open source (Apache 2.0)
- v1.0 July 2015
- Written in Go/Golang
- Often shortened to k8s

Kubernetes

K8 s

CNCF: Cloud Native Computing Foundation

What is Kubernetes?

- Kubernetes is Open Source Orchestration system for Containerized Applications.
- Kubernetes is a platform that eliminates the manual processes involved in deploying containerized applications.
- Kubernetes used to manage the State of Containers.
 - Start Containers on Specific Nodes.
 - Restart Containers when gets Killed.
 - Move containers from one Node to Another.

Why you need Kubernetes?

Kubernetes supplies you with:

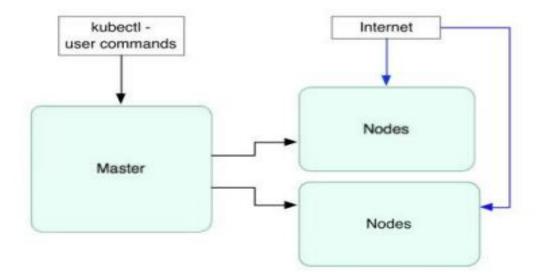

- Service discovery and load balancing
- Storage orchestration
- Automated rollouts and rollbacks
- Automatic bin packing
- Self-healing
- Secret and configuration management

Kubernetes Components

High Level Components

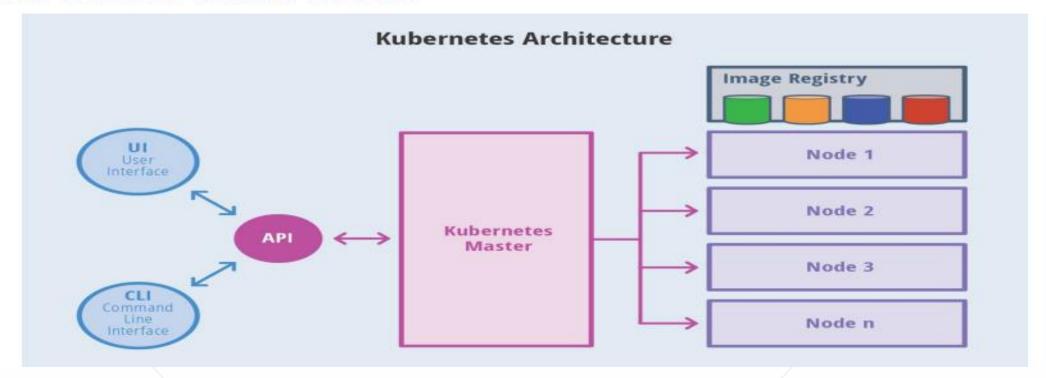

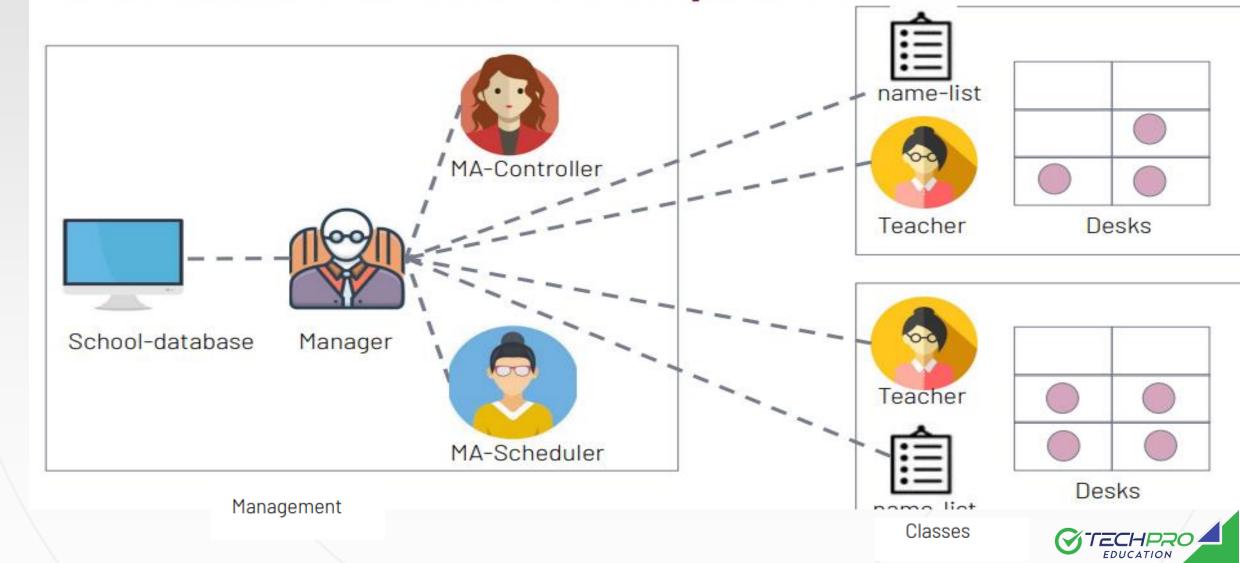

Kubernetes Components

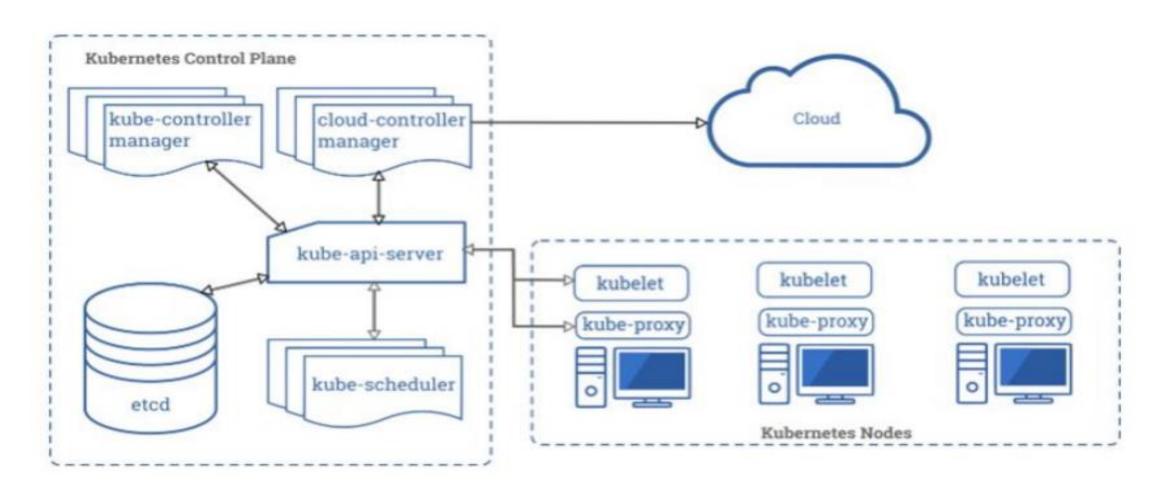

Kubernetes has the following main components:

- One or more master nodes
- One or more worker nodes.

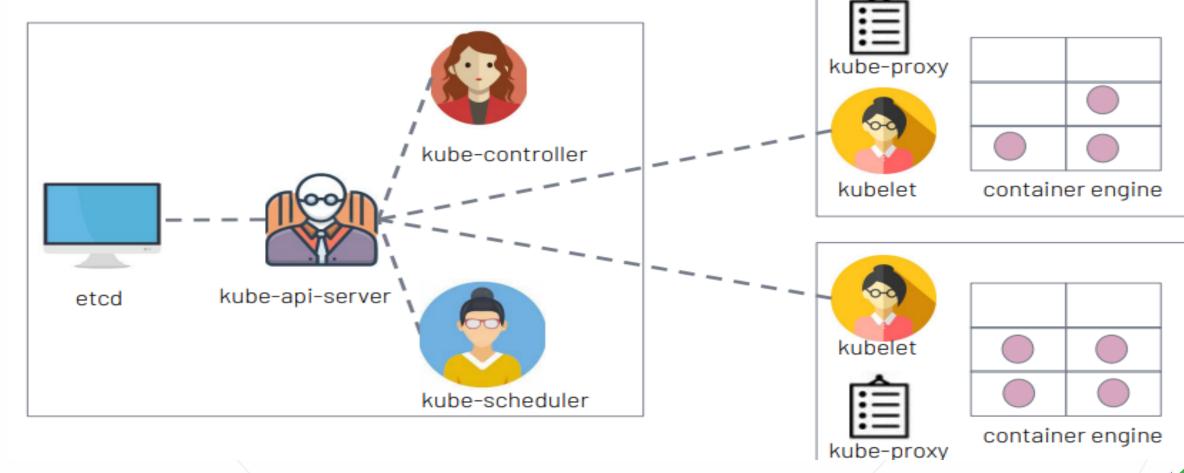

kube-apiserver:

- Provides a forward facing REST interface into the kubernetes control plane and datastore.
- All clients and other applications interact with kubernetes strictly through the API Server.
- Acts as the gatekeeper to the cluster by handling authentication and authorization, request validation, mutation, and admission control in addition to being the front-end to the backing datastore.

kube-apiserver, Kubernetes
API'nı ortaya çıkaran
Kubernetes control plane'in en
önemli bileşeni ve giriş
noktasıdır. Tüm diğer
komponent ve node
bileşenlerinin direkt iletişim
kurabildiği tek komponenttir.

Control Plane Components etcd:

- etcd acts as the cluster datastore.
- Purpose in relation to Kubernetes is to provide a strong, consistent and highly available key-value store for persisting cluster state.
- Stores objects and config information.

Etcd tüm cluster verisi, metadata bilgileri ve Kubernetes'de oluşturulan tüm objelerin bilgilerinin tutulduğu anahtar-değer "key-value" veri deposudur.

kube-controller-manager:

- Serves as the primary daemon that manages all core component control loops.
- Monitors the cluster state via the apiserver and steers the cluster towards the desired state

kube-scheduler:

- Verbose policy-rich engine that evaluates workload requirements and attempts to place it on a matching resource.
- Default scheduler uses bin packing.
- Workload Requirements can include: general hardware requirements, affinity/anti-affinity, labels, and other various custom resource requirements.

Node Components

kubelet:

- Acts as the node agent responsible for managing the lifecycle of every pod on its host.
- Kubelet understands YAML container manifests that it can read from several sources:
 - file path
 - HTTP Endpoint
 - etcd watch acting on any changes
 - HTTP Server mode accepting container manifests over a simple API.

Node Components

kube-proxy:

- Manages the network rules on each node.
- Performs connection forwarding or load balancing for Kubernetes cluster services.
- Available Proxy Modes:
 - Userspace
 - iptables
 - ipvs (default if supported)

Node Components

Container Runtime Engine:

- A container runtime is a CRI (Container Runtime Interface) compatible application that executes and manages containers.
 - Containerd (docker)
 - O Cri-o
 - Rkt
 - Kata (formerly clear and hyper)
 - Virtlet (VM CRI compatible runtime)

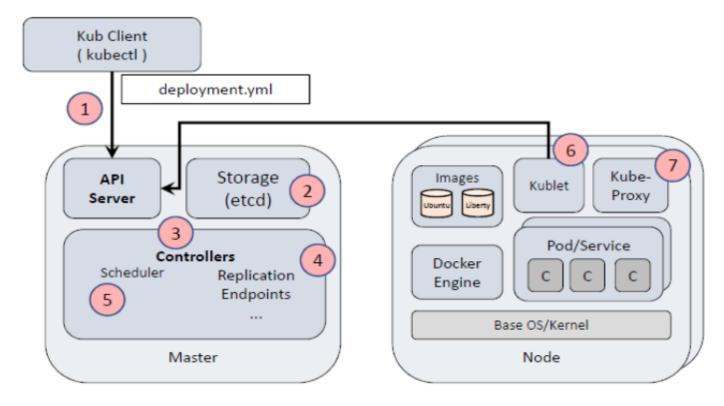

Kubernetes Nasıl Çalışır?

- 1. Kubectl(kubernetes client) isteği API server'a iletir.
- 2. API Server isteği kontrol eder etcd'ye yazar.
- 3. etcd yazdığına dair bilgilendirmeyi API Server'a iletir.
- 4. API Server, yeni pod yaratılacağına dair isteği Scheduler'a iletir.
- 5. Scheduler, pod'un hangi server'da çalışacağına karar verir ve bunun bilgisini API Server'a iletir.
- API Server bunu etcd'ye yazar.
- 7. etcd yazdığına dair bilgiyi API Server'a iletir.
- 8. API Server ilgili node'daki kubelet'i bilgilendirir.
- 9. Kubelet, Docker servisi ile docker soketi üzerindeki API'yi kullanarak konuşur ve konteyner'ı yaratır.
- 10. Kubelet, pod'un yaratıldığını ve pod durumunu API Server'a iletir.
- 11. API Server pod'un yeni durumunu etcd'ye yazar.

K8S

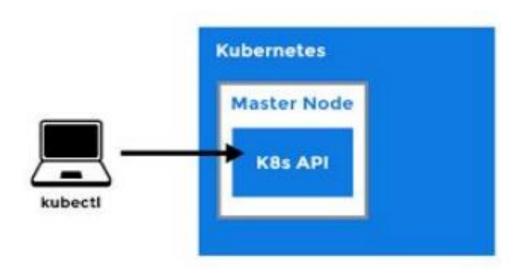

- 1. Kullanıcı "kubectl" aracılığıyla yeni bir uygulama kuruyor
- **2.** API server isteği alır ve DB'de saklar (**etcd**)
- **3.** İzleyiciler/kontrolörler kaynak değişikliklerini algılar ve buna göre hareket eder
- **4.** ReplicaSet izleyici/denetleyici yeni uygulamayı algılar ve istenen sayıda örnekle eşleşen yeni Pod('lar) oluşturur

- 5. Scheduler (Zamanlayıcı), bir kubelet'e yeni Pod('lar) atar
- 6. Kubelet, Pod'ları algılar ve çalışan container aracılığıyla dağıtır (ör. Docker)
- 7. Kubeproxy, hizmet keşfi ve yük dengeleme dahil olmak üzere Pod'lar için ağ trafiğini yönetir

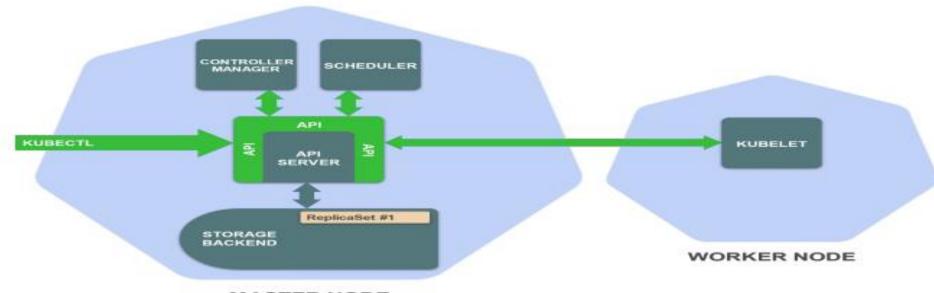

kubectl

kubectl

- MASTER NODE
- kubectl is (almost) the only tool we'll need to talk to Kubernetes
- •It is a rich CLI tool around the Kubernetes API
- Everything you can do with kubectl, you can do directly with the API
- •kubectl can be pronounced "Cube C T L", "Cube cuttle", "Cube cuddle".

How to install and use K8s

- kind: https://kind.sigs.k8s.io/
- minikube: https://minikube.sigs.k8s.io/
- katacoda: https://killercoda.com/playgrounds
- play with kubernetes:
 https://training.play-with-kubernetes.com/
- kubernetes on Docker Desktop
- kubeadm
- kops

- · Less management overhead
- · Automated upgrade of cluster
- · Built-in monitoring and logging
- · Scalable compute

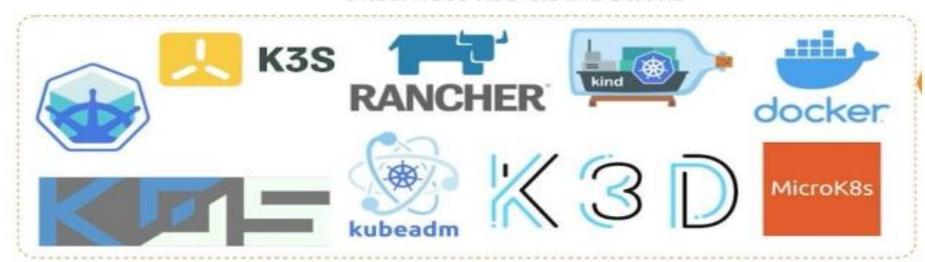

Alternate k8s distributions

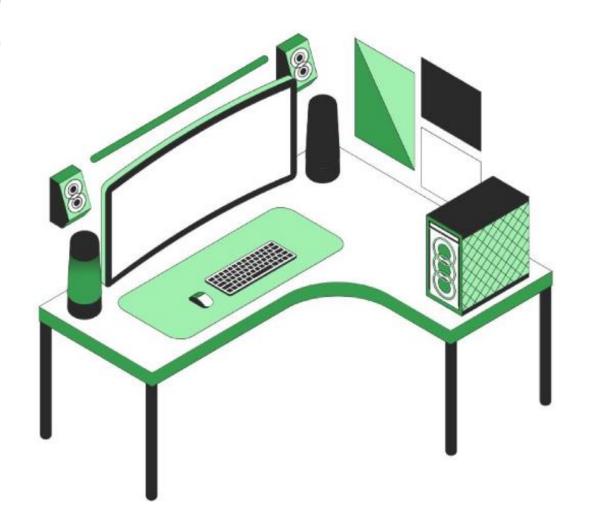

- k8s stands for ...
- k8s CLI is ...
- memory of k8s is ...
- communications center of k8s is ...
- k8s master node is ...
- k8s node components are ..
- k8s control plane components are ..
- pod is ...
